

TASK 12: Serialization & Deserialization – Object Persistence

Tools:

- Primary: IntelliJ IDEA, Java Serialization API
- Alternatives: Eclipse

Hints / Mini Guide:

1. Design a Student class implementing the Serializable interface.
2. Store object state into a file using ObjectOutputStream.
3. Retrieve object data back using ObjectInputStream.
4. Explain why serialVersionUID is important.
5. Mark sensitive fields as transient.
6. Validate restored object data after deserialization.
7. Handle ClassNotFoundException.
8. Demonstrate real-world use of object persistence.

Deliverables:

- Serialized object file
- Program showing successful deserialization

Interview Questions Related To Above Task:

- What is serialization?
- Why transient keyword?
- What happens if serialVersionUID mismatches?
- Is serialization secure?
- Alternatives to serialization?

📌 Task Submission Guidelines

- 🕒 **Time Window:**

You can complete the task anytime between 10:00 AM to 10:00 PM on the given day. Submission link closes at 10:00 PM

- 🔍 **Self-Research Allowed:**

You are free to explore, Google, or refer to tutorials to understand concepts and complete the task effectively.

- 🔧 **Debug Yourself:**

Try to resolve all errors by yourself. This helps you learn problem-solving and ensures you don't face the same issues in future tasks.

- 💰 **No Paid Tools:**

If the task involves any paid software/tools, do not purchase anything. Just learn the process or find free alternatives.

- 📁 **GitHub Submission:**

Create a new GitHub repository for each task.

Add everything you used for the task — code, datasets, screenshots (if any), and a short README.md explaining what you did.

- 📌 **Submit Here:**

After completing the task, paste your GitHub repo link and submit it using the link below:
