

Task 16: Case-Based SQL Analytics (Business Scenarios)

Tools:

- Primary: MySQL 8+ / PostgreSQL
- Alternatives: Google BigQuery Sandbox, SQLite (limited support)

Hints / Mini Guide:

1. Create tables representing a sales system (customers, orders, products).
2. Insert realistic transactional data.
3. Write queries to find top-selling products.
4. Calculate monthly revenue trends.
5. Identify inactive customers.
6. Detect high-value customers using aggregates.
7. Optimize complex analytical queries.
8. Document insights as if reporting to management.

Deliverables:

- SQL script + short analytics report

Final Outcome:

- Intern solves real business problems using SQL.

Interview Questions Related To Above Task:

- How SQL is used in business analytics?
- What defines a high-value customer?
- Why time-based analysis is important?
- SQL vs BI tools?
- How to optimize analytical queries?

📌 Task Submission Guidelines

■ 🕒 Time Window:

You can complete the task anytime between 10:00 AM to 10:00 PM on the given day. Submission link closes at 10:00 PM

■ 🔍 Self-Research Allowed:

You are free to explore, Google, or refer to tutorials to understand concepts and complete the task effectively.

■ 🛠️ Debug Yourself:

Try to resolve all errors by yourself. This helps you learn problem-solving and ensures you don't face the same issues in future tasks.

■ 💰 No Paid Tools:

If the task involves any paid software/tools, do not purchase anything. Just learn the process or find free alternatives.

■ 📁 GitHub Submission:

Create a new GitHub repository for each task.

Add everything you used for the task — code, datasets, screenshots (if any), and a short README.md explaining what you did.

📌 Submit Here:

After completing the task, paste your GitHub repo link and submit it using the link below:
