

Task 13: Implement Dark & Light Theme Toggle

Tools:

- Primary: VS Code, JavaScript, CSS Variables
- Alternatives: CodePen

Hints / Mini Guide:

1. Define CSS variables for colors such as background, text, and accent.
2. Create two theme configurations using CSS custom properties.
3. Add a toggle switch or button to change themes.
4. Write JavaScript to switch theme values dynamically.
5. Store user theme preference in LocalStorage.
6. Load saved theme preference on page refresh.
7. Ensure all components adapt correctly to theme change.
8. Test contrast ratios for accessibility.
9. Refactor CSS to minimize duplication.

Deliverables:

- Persistent dark/light mode feature
- Clean theme management logic

Interview Questions Related To Above Task:

- What are CSS variables?
- How does LocalStorage work?
- Why store user preferences?
- Accessibility concerns with dark mode?
- Difference between cookies and LocalStorage?

📌 Task Submission Guidelines

- 🕒 **Time Window:**

You can complete the task anytime between 10:00 AM to 10:00 PM on the given day. Submission link closes at 10:00 PM

- 🔍 **Self-Research Allowed:**

You are free to explore, Google, or refer to tutorials to understand concepts and complete the task effectively.

- 🔧 **Debug Yourself:**

Try to resolve all errors by yourself. This helps you learn problem-solving and ensures you don't face the same issues in future tasks.

- 💰 **No Paid Tools:**

If the task involves any paid software/tools, do not purchase anything. Just learn the process or find free alternatives.

- 📁 **GitHub Submission:**

Create a new GitHub repository for each task.

Add everything you used for the task — code, datasets, screenshots (if any), and a short README.md explaining what you did.

- 📌 **Submit Here:**

After completing the task, paste your GitHub repo link and submit it using the link below:
